Consortium/LLNL at: http://image.llnl.gov.Series: IRAK Plate: 50 Row: a Column: 11
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 21914924.

Group. Further information can be found at http://www.aanger.ac.uk/HGP/Chr9
RP11-9M16 is from the library RPCI-11.1 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm
VECTOR: pBAce3.6
IMPORTANT: This sequence is not the entire insert of clone RP11-9M16 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true right end of clone RP11-9M16 is at 132292 in this sequence. The true left end of clone RP11-40033 is at 124695 in this sequence. The true right end of clone RP11-8211 is at 2000 in this sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             unmattered 1.1-10.1-20.0.1 Wellowing time. Statists interious, naturating a summatter of 1.1-20.0.2 wellower the statists interior of the court of the sequence version replaced gil20128659.

In May 25. 2002 this sequence version replaced gil20128659.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone, as we submit sequences with corresponding to the overlapping clone, as we submit sequences with conjy a small overlapping clone, as we submit sequences with conjy a small overlapping clone, as we submit sequences with conjy a small overlapping clone, as we submit sequences with conjy as small overlapping clone, as we submit sequences with conjy as a described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one Mil3 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em; EMBL; Sw;, SwiSSPROT; Tr;, TREMBL; Wp;, WORMPEP; Information on the WORMPEP database can be found at the their define the PRCI-23 Mouse PAC library constructed by the group of Fieter de Jong.

                                                                  AL681828

Mouse DNA sequence from clone RP23-340H1 on chromosome 4 Contains the 3' end of the gene for a novel collagen triple helix repeat and fibrillar collagen C-terminal domain containing protein, the Orml, orm2 and Orm3 genes for orosomucoid 1, 2 and 3, an orosomucoid pseudogene, the gene for a novel protein similar to human AT-hook protein AKNA, gene 4933437NO3Rik, gene 1110035607Rik (C430046P22Rik) and two CpG islands, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           224. .48609 | Join (224. .268,511.") | Join (224. .268,511.") | Join (224. .268,511.") | Join (224. .268,511.") | Join (224. .268,511.") | Join (224. .268,511.") | Join (224. .268,514.") | Join (224. .268,514.") | Join (224. .268,514.") | Join (222,147) | Join (222,149) | Join (222,147) | Join (222,149) | Join (222,166,2. .16705,18803. .18856,2834) | Join (222,147) | Join (222,149) | Join (222,147) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (222,149) | Join (2222,149) | Join

Direct Submission

Submitted (17-JAN-2001) Genome Analysis, Institute of Molecular Biotechnology, Beutenberstr. 11, Jena 07745, Germany

* NOTE: This is a 'working draft' sequence. It currently

* Consists of 3 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be prestred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 199354: contig of 199354 bp in length

             NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html). NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    226 ThrValAspGluThrLysTrpIleAlaSerSerArgIleArgGluThrMetAlaAsnSer 245

Bonaldo, Lennon and Soares, Genome Research on a 1% agarose
gel. First strand GDNA synthesis was primed with oligo-dr
primer containing a Not I site. Double strand cDNA was
size selected according to mRNA size fraction, ligated
with EcoR I adaptor, digested with NotI and then cloned
directionally into pYX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is AGCOAGACAC, This library was created for the University
lows Brain Anatomy Project (BMAP): 'Gene Discovery in the
Developing Mouse Nervous System', supported by National
Institute of Mental Haalth (NIMH), Hemin Chin, Ph.D.,
program coordinator."

Description

Salceda S, Macina RA, Sun Y, Liu C; WPI; 2002-713345/77.

The invention relates to human breast specific nucleic acids (I) comprising: (a) a sequence encoding any one of 95 protein sequences (ABP6614-ABP66708); (b) any one of 115 polynucleotide sequences (ABV83558-ABV83672); (c) a molecule that selectively hybridizes to (a) or (b); (d) a molecule having at least 60% sequence identity to (a) or The breast specific nucleic acid molecules, polypeptides and antibodies are useful for identifying, diagnosing, monitoring, staging, imaging and treating breast cancer and non-cancerous disease states in breast tissue. They are also useful for producing transgenic animals and cells and producing engineered breast tissue for treatment and research. The

transgenic animals are useful as animal model systems used in elaborating the biological function of the polypeptides, studying conditions and/or discretes associated with aberrant expression and in screening for compounds effective in ameliorating the conditions. The polymucleotides are useful for gene therapy and in vaccines
                                                                                                                                                                                      120

The invention relates to human breast specific nucleic acids (1) comprissing: (a) a sequence encoding any one of 95 protein sequences (ABP666108); (b) a wole of 115 polymucleotide sequences (ABV83558-ABV83672); (c) a molecule that selectively hybridizes to (a) or (b); (d) a molecule acid molecules, polypeptides and antibodies are useful for identifying, diagnosing, monitoring, staging, imaging and treating breast cancer and non-cancerous disease states in breast tissue. They are also useful for producing transgenic animals and cells and producing engineered breast tissue for treatment and research. The transgenic animals are useful as animal model systems used in elaborating the biological function of the polypeptides, studying conditions and/or disorders associated with aberrant expression and in screening for compounds, effective in ameliorating the conditions. The polymucleotides

New isolated breast specific nucleic acid molecules and polypeptides, useful for identifying, diagnosing, monitoring, staging, imaging and treating breast cancer and non-cancerous disease states in breast tissue.

The method is useful in drug development, particularly for conducting toxicity studies and analysis before a new drug or compound is approved for human consumption or use. The method is also useful in determining toxicological responses to a new drug. This polynucleotide sequence represents a phase-1 rat CT gene of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            858
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABBT30772). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            281 CANGICIGICIGICIGICIGICIGICICICICICICIGIGIGIGIGIGIGIGIGIGIGIGIGI

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and corber cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic and ending aciderofaments, diabetes mellitus, Crohn's disease, cancering and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed approach of the printed discastion, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; SEQ ID NO 7587; 1701pp + Sequence Listing; English.

The invention comprises the amino acid and coding sequences of isolated fertility restorer proteins. The DNA and protein sequences of the invention are useful for restoring fertility in male sterile planes, such as Brassica napus plants. The DNA and protein sequences of the invention are useful for increasing production of viable pollen in a plant. The DNA and protein sequences are also useful as selection markers to identify transformed plant cells. The present genomic DNA sequence contains coding sequences for fertility restorer proteins of the invention.

Sequence 271990 BP; 89597 A; 47325 C; 46930 G; 88078 T; 0 U; 60 Other;

New nuclear fertility restorer genes, useful for restoring fertility in cytoplasmic male-sterile plants such as Brassica napus plants, or for increasing production of viable pollen in a plant.

The present invention describes an isolated nucleic acid (I) comprising a single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid having nucleotide sequence that hybridises to and (ii) a nucleic acid having nucleotide sequence that hybridises to (i), or its complement under highly stringent hybridisation conditions. (I) an isolated oligonucleotide (II) comprising at least of 10 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O. niloticus sNPs, O. niloticus microsatellites Atlantic halibut SNPs, Con polymorphic sites and seabase polymorphic sites, or their complement; (2) a primer pair (II) suitable for use in PCV, comprising two (II) capable of amplifying a nucleotide sequence chosen from S. salar SNPs and, O. niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod niloticus snps, O. niloticus microsatellites, Atlantic halibut SNPs, cod comprising a collection of candidate parent genotype database polymorphis sites, and seabase polymorphis sites, and comparing a candidate parent genotype and one of the candidate parent genotype and one of the candidate parent genotype and one of the candidate parent genotype and one of the candidate parent genotype and one of the candidate parent genotype and one of the candidate parent genotype includes against sample such as family salmonidae, S. salar, Tilapha, O. niloticus, craibbow trout, halibut, salmonidae, S. salar SNPs and O. niloticus applymorthic cod involved from nucleotide sequence of S. salar SNPs and O. niloticus contentifying nucleic acid molecule comparising a polymorphic comparising commands or commands and parent parent commands of sequence in a sample commands or commands and parent such as sample contacting nucleic acid molecule comparises to (II) is useful for executed from nucleotide sequence contacting nucleic acid molecule comparises to (II) derived from nucleotide sequence source and commands and commands and commands and commands and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequence in a sample, comprising contacting the sample containing nucleic acids with one or more (II) which is derived from 0. niloticus microsatellite, 0. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic sites or seabass polymorphic sites, and identifying a nucleic acid that hybridises to (II). (III) is useful for detecting nucleic acid molecule comprising a microsatellite sequence in sample. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                               Novel isolated nucleic acid molecule comprising single nucleotide polymorphism associated with fish, useful for forming PCR primers which are used for detecting single nucleotide polymorphisms in fish nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tch al Similarity 68.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLis176-ABL30511), expressed DNA sequences (ABLis175-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               397
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               338 GIGIGIGIGIGIGIGIGIGIGIGICTICTCCTCCTTTCATCCTATCATACTAG

RESULT

The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a invention also encompasses expression vectors and host cells comprising a cCA nucleic acid, a polypeptide (sapecially an antibody) that specifically binds to the protein, and a biochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using concepenic retroviruses, which insert into the genome of the host organism or random. Many of these do not carry transduced host encogenes or carcinoma fespecially breast cancer, prostate cancer incidence is a direct consequence of the effects of proviral integration into host carcinoma (sepecially breast cancer, prostate cancer, lymphoma or carcinoma (sepecially to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acids, proteins and antibodies are also useful as therapeutic agents and in screening and evaluating drug candidates. The present sequence of the invention. Note: The complete sequence data for this entered and in screening and evaluating drug candidates. The patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Mouse, murine, carcinoma associated, oncogene, carcinoma, cancer; breast, prostate, lymphoma, leukaemia, cytostatic, gene therapy, drug screening; New recombinant nucleic acid encoding carcinoma associated protein, useful for preparing compositions for treating carcinomas. Mouse Itk carcinoma associated gene, SEQ ID NO:1319 Claim 1; SEQ ID NO 1319; 245pp; English.

The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polymucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypepcides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a mouse gene of the invention. New recombinant nucleic acid, useful for treating carcinomas, lymphomas, cancers, neoplasm, adenocarcinoma, or sarcomas. Sequence 67832 BP; 17054 A; 15504 C; 15824 G; 18278 T; 0 U; 1172 Other; mouse; ds; cytostatic; gene therapy; vaccine; carcinoma; lymphomas; cancer; neoplasm; adenocarcinoma; sarcoma; gene. Length 67832; Query Match
Best Local Similarity 83.8%; Pred. No. 3.5e-08;
Matches 83; Conservative 0; Mismatches 16; claim 1; SEQ ID NO 367; 2304pp; English BP. useful

```
The invention relates to a nucleic acid array, where each coordinate contains a single nucleic acid species having one of 770 nucleotide sequences (appearing as ABS76747-ABS77516) as of a Xenopus embryonic gene product, or its complement or hybridisable fragment of not less than 20 contiguous nucleotides of one of those sequences. Also included are detecting differential expression of embryonic genes, comprising in a nucleic acid array comprising genes expressed in embryonic contacting a nucleic acid array comprising genes expressed in embryonic but not mature cells with nucleic acids from sample and control cells; and cletecting differential hybridisation of nucleic acids from the sample cells relative to the control cells; and detecting defects in care contacting nucleic acids from test cells undergoing development with a nucleic acid array of gene products known to play a fundamental role in the development process; and (b) detecting a difference in expression of a fundamental gene in the sample cells relative to a standard. The invention is useful to identify genes involved in embryonic development and related processes such as cell differentiation. This would be useful for diagnosing developmental contacting and for identifying different types of embryonic cells. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             441 cirrangaaracargiraaaaaaaaacaaragirgigigigigigigigigigigigigigigi

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carcinoma-associated (CA) genes from the 50 tables given in the specification. The CA proteins are secreted, transmembrane or intracellular proteins. The recombinant nucleic acids are useful for screening for drug candidates for diagnosing or treating carcinomas. Sequences given in ADC85215-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 67832 BP; 17054 A; 15504 C; 15823 G; 18278 T; 0 U; 1173 Other;

The present invention relates to a method of identifying a compound that modulates attention deficit hyperactivity disorder (ADHD) in a mammal. The method comprises administering a test compound to an invertebrate, and measuring a foraging behaviour of the invertebrate, where the compound that modulates the foraging behaviour of the invertebrate is characterised as a compound that modulates ADHD in a mammal. The compound identified by the new method of the invention is useful for diagnosing or treating ADHD, hypertension or other diseases associated with a nitric oxide/cGMP-dependent protein kinase network in a mammal, particularly humans. The method distinguishes a compound that has a specific effect on ADHD, hypertension or other diseases associated with a nitric oxide/cGMP-dependent kinase protein network in a mammal from a compound that has a non-specific effect. The present sequence represents a DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated substantially pure plant satellite artificial chromosome useful for producing transgenic plant, producing gene product, cloning centromere from plant.
Identifying a compound that modulates an attention deficit hyperactivity disorder (ADHD) for treating e.g. ADHD or hypertension, comprises measuring a foraging behavior an invertebrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chromosome; SATAC; transgenic; transgenic plant;

                                                                                                                                                                                                                                                                                            The invention relates to preparing cells or cell lines comprising introducing a mammalian artificial chromosome that a comprises a nucleic acid encoding a therapeutic product or a gene product into a cell or tissue of a host animal. The artificial chromosome is a mammalian SATAC (satellite artificial chromosome) or a minichromosomes based on the method is useful for preparing cells or cell lines, which may be employed in cell-based methods for production of heterologous proteins, gene therappy, or generation of transgenic non-human animals. The cells or cell lines are also useful for cell fusion, as recipient cells for donor DNA encoding a gene or multiple genes, or for delivery of heterologous DNA into cells. The present sequence is the Human ribosomal DNA complete repeating unit, useful for taxing artificial chromosomes to perior perior perior perior perior man animal chromosomes to perior perior manner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  renergrenergrenergrenergrenergrenergrenergrenergrenergrenerg
                                                                                                                                  Preparing cells or cell lines for use in cell-based methods for heterologous protein production or gene therapy, by introducing a minichromosome or a mammalian satellite artificial chromosome into a cell or tissue of a host.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

ö The present invention relates to novel pure plant satellite artificial chromosome (SATARC). Sequences of the invention are useful for producing transpenic plants and gene products. They are also useful for cloning a centromere from a plant. The present sequence is human ribosomal DNA (rDNA) repeat region used in the exemplification of the invention Query Match
